MOC News is a full-stack web application that mimics NPR, CNN, and The New York Times. Clients will be able search news topics by interest. Categories will include: Entertainment, Global News, International News, Politics, and Sports.

Clients (not logged in) who visit the site, will see news headlines in a variety of categories. They will also see the number of likes on each news story.

Once a client logs in, they will be asked to specify their news interests. News interests will then be stored in the client's profile. Clients will be able to search for news of interest and create bookmarks for news stories they'd like to refer back to. Clients will also be able to add a 'like' to any news story they have a particular interest in. Lastly, clients will be able to create comments on news stories and respond to other client comments.

We will use Java, Spring Boot , Spring Rest Annotations, Javascript, HTML, CSS, SQL, and React.

Application Architecture
